

Aromatic Compounds as Anti-Inflammatory, Immunomodulatory and Anti-Proliferatory Agents

Description

5

The present invention relates to novel compounds that can be used as antiinflammatory, immunomodulatory and antiproliferatory agents. In particular the invention refers to new compounds which inhibit dihydroorotate dehydrogenase (DHODH), a process for their manufacture, pharmaceutical compositions containing them and to their use for the treatment and prevention of diseases, in particular their use in diseases where there is an advantage in inhibiting dihydroorotate dehydrogenase (DHODH).

10 Rheumatoid arthritis (RA) is a disease which is quite common especially among elder people. Its treatment with usual medications as for example non-steroid anti-inflammatory agents is not satisfactory. In view of the increasing ageing of the population, especially in the developed Western countries or in Japan the development of new medications for the treatment of RA is urgently required.

20 WO 99/38846 and EP 0 646 578 disclose compounds which are reported to be useful for treatment of RA.

25 A medicament against rheumatoid arthritis with a new mechanism of action, leflunomide, was recently put on the market by the company Aventis under the tradename ARAVA [EP 780128, WO 97/34600]. Leflunomide has immunomodulatory as well as anti-inflammatory properties [EP 217206, DE 2524929]. The mechanism of action is based upon the inhibition of dihydroorotate dehydrogenase (DHODH), an enzyme of the pyrimidine biosynthesis.

30 In the body, DHODH catalyzes the synthesis of pyrimidines, which are necessary for cell growth. An inhibition of DHODH inhibits the growth of (pathologically) fast proliferating cells, whereas cells which grow at normal speed may obtain their required pyrimidine bases from the normal metabolic cycle. The most important types of cells for the immuno response, the lymphocytes, use exclusively the synthesis of pyrimidines for their growth

and react particularly sensitively to DHODH inhibition. Substances that inhibit the growth of lymphocytes are important medicaments for the treatment of auto-immuno diseases.

The DHODH inhibiting leflunomide (ARAVA) is the first medicament of this class of compounds (leflunomides) for the treatment of rheumatoid arthritis. WO 99/45926 is a further reference that discloses compounds which act as inhibitors of DHODH.

In EP 463444, WO 98/57937, EP 150034, Nucleosides & Nucleotides 1997, 16 (10 & 11), 2025-2033; Egyptian Journal of Pharmaceutical Sciences 1991, 32 (1-2), 331-339, Journal für Praktische Chemie 1991, 333 (4), 619-624, Archives of Pharmacal Research 1990, 13 (4), 338-341, Sulfur Letters 1988, 7 (4), 127-136, Synthesis 1988, 6 449-452, Sulfur Letters 1987, 7 (19), 19-24, Archiv der Pharmazie 1987, 320 (12), 1281-1283, Natl. Def. Med. Cent. 1983, 35 (1), 57-64 and Sch. Pharm. Sci. 1977, 97 (4), 410-415 a number of five membered aromatic ring systems fused to substituted malcimide are described.

It is an object of the present invention to provide alternative effective agents which can be used for the treatment of diseases which require the inhibition of DHODH.

Accordingly, a novel class of compounds with an inhibitory effect on DHODH, in particular human DHODH, was found.

The present invention is also directed to compounds of the general formula (II)

The invention also provides a pharmaceutical composition comprising a compound of formula (II) including the compounds excluded by the disclaimers, in free form or in the form of pharmaceutically acceptable salts and physiologically functional derivatives, together with a pharmaceutically acceptable diluent or carrier therefore.

The term "physiologically functional derivative" as used herein refers to compounds which are not pharmaceutically active themselves but which are transformed into their pharmaceutical active form in vivo, i.e. in the subject to which the compound is administered. Examples of physiologically functional derivatives are prodrugs such as those described below in the present application.

In another aspect, the present invention also provides a method for the treatment or prophylaxis of a condition where there is an advantage in inhibiting dihydroorotate dehydrogenase (DHODH) which comprises the administration of an effective amount of a compound of formula (II) and physiologically acceptable salts or physiologically functional derivatives thereof.

The invention is also directed to the use of compounds of the formula (II) and of their pharmacologically tolerable salts or physiologically functional derivatives for the production of a medicament for the prevention and treatment of diseases, where inhibition of the pyrimidine biosynthesis is of benefit.

In addition, the present invention provides methods for preparing the compounds of the invention such as compounds of formula (II).

The compounds of formula (II) may be obtained via various methods. In preferred embodiments of the invention the following method is used for the synthesis of derivatives of formula (II).

5 Method 1:

The synthesis of dicarboxylic acid dimethylester is described in WO 02/07655.

This dicarboxylic acid dimethyl ester can be substituted on the ring system as described by T. Harrison et.al., Tetrahedron Vol. 45, No.16, 1989, 5247-5262. This dicarboxylic acid dimethyl ester can then be converted into the corresponding acid anhydride.

10

These anhydrides may then be reacted with the corresponding amines to the desired amides of formula (II). This reaction steps are analog to the reaction steps described in WO 02/07655.

- 15 The compounds of formula (II) in each case [$r = 0$] can be synthesized analog to the four methods described in WO 02/07655.

In addition, the present invention provides methods for preparing the desired hydroxamic acids of formula (II).

- 20 One method for the synthesis of compounds of formula (II) comprises the conversion of an acid to the corresponding acid chloride and reacting the acid chloride with hydroxylamine (Watanabe et al., 1989, J. Org. Chem., 54, 17, 4088-4097; Shishido et al., 1992, J. Org. Chem., 57, 10, 2876-2883).

- 25 Other methods for the preparation of formula (II) are described by Woo et al., 2002, J. Med. Chem. 45, 2877-2885; Knorr et al., 1989, Tetrahedron Lett., 30, 1927-1930, Carpino, 1993, J. Am. Chem. Soc., 115, 4397-4398 and Albericio et.al., 1998, J. Org. Chem., 63, 9678-9683.

- 30 Another method for the preparation of compounds of formula (II) is the reaction of the corresponding ester with hydroxylamine as described by Stowell et al., 1995, J. Med. Chem., 38, 8, 1411-1413.

- 35 The synthesis of amides of formula (II) is described by J. Zabicky in "The Chemistry of Amides", in the serial of S. Patai (ed.), "The Chemistry of Functional Groups", John Wiley & Sons, 1975, p. 74-131. Methods for preparing thioamides are described in Houben-

Weyl, J. Falbe (ed.), G. Thieme Verlag, vol. E5, p. 1219-59. Methods for preparing sulfamides are described by Caldwell *et al.*, *J. Am. Chem. Soc.* 1944, 66, 1479-82, or by Flynn *et al.*, *Med. Chem. Res.*, 1998, 8, 219-43 and Dziadulewicz *et al.*, *Bioorg. Med. Chem. Lett.* 2001, 11, 5, 705-10.

5

In addition, the present invention provides methods for preparing compounds of formula (II) wherein A is a heterocyclic ring system. For example 3,4-dicarboxylic acids of thiophene, furan and pyrrole were converted into the corresponding anhydrides and reacted with amines in analogy to DE 3933573 and D. P. Arnold, *Aust. J. Chem.* 44, 1991, 323-330.

10

3-carboxamide-2-carboxylic acids or 2-carboxamide-3-carboxylic acids of thiophene, furan and pyrrole were synthesized from 3-carboxylic acids or 2-carboxylic acids, respectively, by amidation of the acid group and subsequent directed ortho-metalation in 2- or 3-position, respectively, followed by addition of carbon dioxide as electrophile according to DE 3933573.

15

Differently 4,5-substituted 2,3-pyrroledicarboxylic esters and acids were prepared according to literature procedures:

20

a) 1-hydroxy-4,5-dimethyl: from dialkyl acetylenedicarboxylates and butane-2,3-dione monooximes, I. Yavari *et al.*, *Synth. Commun.* 26, 1996, 4495-4499.

b) 3-hydroxy-4-alkyl or -aryl: from dialkyl acetylenedicarboxylates and amino acid esters, P. Kolar *et al.*, *Synth. Commun.* 24, 1994, 1887-1893.

c) mixed 4,5-alkyl/aryl: from dialkyl acetylenedicarboxylates and aryl- or benzylhydrazones, J. Barluenga *et al.*, *Synthesis*, 1975, 642-643.

25

d) 4-methyl: from N-acetylphthalimide and diethyl oxalacetate, R. E. Lancaster *et al.*, *J. Org. Chem.* 23, 1958, 1208-1209.

The pyrrole diester can be converted into the corresponding acids and anhydrides for further amidation reactions or directly transformed into the corresponding monohydrazinocarbonyls (M. T. Garcia-Lopez *et al.*, *J. Chem. Soc. Perkin Trans.*, 1978, 483-487). Diethyl 2-alkyl-, -aryl-, or -aminothiazole-4,5-carboxylates were synthesized from diethyl α -halo- β -oxosuccinate and the respective thioamides or thiourea in analogy to W.

30

K. Anderson et al., *J. Med. Chem.* 27, 1984, 1559-1565; E. H. Huntress et al., *J. Am. Chem. Soc.* 65, 1943, 2167-2169; L. H. Conover et al., *J. Am. Chem. Soc.* 72, 1950, 5221-5225; M. Robba et al., *Bull. Soc. Chim. Fr.*, 1969, 1762-1768.

All diesters were converted into the monoamides as described above. Mixtures of
5 regioisomers resulting from the amidation reaction had to be separated.

Aromatic systems containing a sulfur atom within the aromatic framework can be converted into the corresponding S-monooxides or -dioxides by oxidation of the afore mentioned heterocycles with m-chlorobenzoic acid, either with or without trifluoroborate
10 etherate being added (N. Furukawa et al., *Heterocycles* 44, 1997, 61-66).

The invention also provides methods for preparing compounds of formula (II) wherein R² together with the nitrogen atom which is attached to R⁸ form a 6 membered heterocyclic ring system.

15 For example diethyl 3-acetyl-2-methylfuran-4,5-dicarboxylate was prepared from acetylated sulphonium methylides and diethyl acetylenedicarboxylate according to *Tetrahedron* 26, 1970, 4353-4360. The diester was converted into the corresponding anhydride, which was next reacted with an amine as described above to give a mixture of regioisomers for monoamidation product. Upon esterification of the carboxylic acid using
20 dicyclohexylcarbodiimide, 4-dimethylaminopyridine and ethanol in methylene chloride, the two regioisomers were separated, and α -bromination at the acetyl functionality of ethyl 3-acetyl-2-methyl-4-carboxamide-furan-5-carboxylate was achieved either with bromine in methylene chloride or copper dibromide in ethyl acetate in analogy to literature procedures: S. Laufer et al., *Arch. Pharm.* 330, 1997, 307-312; S. K. C. Devi et al., *Synth.*
25 *Commun.* 32, 2002, 1523-1528.

10 The compounds of formula (II) and their pharmacologically acceptable salts can be administered to animals, preferably to mammals, and in particular to humans, dogs and chickens as therapeutics per se, as mixtures with one another or in the form of pharmaceutical preparations which allow enteral or parenteral use and which as active constituent contain an effective dose of at least one compound of formula (II), or a salt thereof, in addition to customary pharmaceutically innocuous excipients and additives. The compounds of formula (II) can also be administered in form of their salts, which are obtainable by reacting the respective compounds with physiologically acceptable acids and
15 bases.

The therapeutics can be administered orally, e.g. in the form of pills, tablets, coated tablets, sugar coated tablets, hard and soft gelatin capsules, solutions, syrups, emulsions or suspensions or as aerosol mixtures. Administration, however, can also be carried out
20 rectally, e.g. in the form of suppositories, or parenterally, e.g. in the form of injections or infusions, or percutaneously, e.g. in the form of ointments, creams or tinctures.

In addition to the active compounds of formula (II) the pharmaceutical composition can contain further customary, usually inert carrier materials or excipients. Thus, the
25 pharmaceutical preparations can also contain additives, such as, for example, fillers, extenders, disintegrants, binders, glidants, wetting agents, stabilizers, emulsifiers, preservatives, sweetening agents, colorants, flavorings or aromatizers, buffer substances, and furthermore solvents or solubilizers or agents for achieving a depot effect, as well as salts for changing the osmotic pressure, coating agents or antioxidants. They can also
30 contain two or more compounds of formula (II) or their pharmacologically acceptable salts and also other therapeutically active substances.

Thus, the compounds of the present invention can be used in the form of one substance alone or in combination with other active compounds – for example with medicaments already known for the treatment of the aforementioned diseases, whereby in the latter case a favorable additive, amplifying effect is noticed. Suitable amounts to be administered to humans range from 5 to 500 mg.

To prepare the pharmaceutical preparations, pharmaceutically inert inorganic or organic excipients can be used. To prepare pills, tablets, coated tablets and hard gelatin capsules, for example, lactose, corn starch or derivatives thereof, talc, stearic acid or its salts, etc. can be used. Excipients for soft gelatin capsules and suppositories are, for example, fats, waxes, semi-solid and liquid polyols, natural or hardened oils etc. Suitable excipients for the production of solutions and syrups are, for example, water, sucrose, invert sugar, glucose, polyols etc. Suitable excipients for the production of injection solutions are, for example, water, alcohols, glycerol, polyols or vegetable oils.

The dose can vary within wide limits and is to be suited to the individual conditions in each individual case. For the above uses the appropriate dosage will vary depending on the mode of administration, the particular condition to be treated and the effect desired. In general, however, satisfactory results are achieved at dosage rates of about 1 to 100 mg/kg animal body weight preferably 1 to 50 mg/kg. Suitable dosage rates for larger mammals, for example humans, are of the order of from about 10 mg to 3 g/day, conveniently administered once, in divided doses 2 to 4 times a day, or in sustained release form.

In general, a daily dose of approximately 10 mg to 5000 mg, preferably 50 to 500 mg, per human individual is appropriate in the case of the oral administration which is the preferred form of administration according to the invention. In the case of other administration forms too, the daily dose is in similar ranges.

The compounds of formula (II) can also be used in the form of a precursor (prodrug) or a suitably modified form, that releases the active compound *in vivo*. Such precursors such as the preferred embodiments of R^6 or R^1 can be obtained for example by masking the free acid group with an ester group, which is then in turn transformed into the free acid group *in vivo* [F. W. Sum et. al. Bioorg. & Med. Chem. Lett. 9 (1999), 1921-1926; Ada Rephaeli et.

al. Drug Development Research 50 (2000) 379-391; H. Ishikawa, Current Med. Chem. 6 (1999), 575-597]. Further precursors for the preferred embodiment of R⁶ or R¹ is tetrazole, another metabolism-resistant isosteric replacements for the carboxylic acid group as described by J. Herr, Bioorg. & Med. Chem. Lett. 10 (2002), 3379-3393. Other precursors
 5 for the preferred embodiments of R⁵ can be obtained for example by masking the amidine with an hydroxy group, which is then in turn transformed into the free amidine *in vivo* [R.M. Scarborough, J. Med. Chem. 43, 19, (2000), 3454-3473].

Examples

10 Method A: General method for synthesis of 5-membered heteroaromatic 2,3-dicarboxylic acid mono amide derivative

The biphenyl-derivative was dissolved under inert atmosphere in dry dichloromethane. triethylamine (1.2 Equ) was added in one portion. Freshly prepared thiophene-3-carbonyl chloride (1.2 Equ) or furan-3-carbonylchloride (1.2 Equ) or the respective heteroaromatic
 15 2'-carbonyl chloride solved in dichloromethane was added drop wise. After addition the mixture was heated at 45°C for 4 h. The solvent was removed by vacuum. The amide was solved in tetrahydrofuran and cooled to -78°C. Butyl lithium (2 equ)was added during 15 minutes and the mixture was stirred at - 78°C for 30 minutes. Solid carbon dioxide was added in one portion and the mixture was allowed to warm to room temperature within 4 h.
 20 The reaction was quenched with 2 n HCl extracted 3 times with ethyl acetate, the combined organic layers were washed with sodium bicarbonate and brine, dried over MgSO₄ and filtered. The solvent was removed by vacuum. The material was purified by HPLC (using a water/acetonitrile gradient) to yield the pure product.

25 Method C: General method for the 5-membered hetero aromatic 3,4-carboxylic acid mono amide derivatives

Thiophene-3,4-dicarboxylic acid or furan-3,4-dicarboxylic acid was suspended in acetic acid anhydride and heated at 100°C for 3 h. The reaction solution was cooled to room temperature. The solvent was removed by vacuum. It was dried for 6 h to give the
 30 anhydride in quantitative yield. The resulting anhydride was solved in dichloromethane (0.36 mmol/ml). To this solution of the biphenyl amine (1 equ) derivative was added and the reaction mixture was heated at 45°C for 12 h. The solvent was removed by vacuum. The product was purified by HPLC. Yields are between 30 and 70 %

3. Inhibition Assay of DHODH activity

The standard assay mixture contained 50 μM decyclo ubiquinone, 100 μM dihydroorotate, 20 60 μM 2,6-dichloroindophenol, as well as 20 mU DHODH. The volume activity of the recombinant enzyme used was 30 U/ml. Measurements were conducted in 50 mM TrisHCl (150 mM KCl, 0.1% Triton X-100, pH 8.0) at 30°C in a final volume of 1 ml. The components were mixed, and the reaction was started by adding dihydroorotate. The course of reaction was followed by spectrophotometrically measuring the decrease in 25 absorption at 600 nm for 2 min.

Inhibitory studies were conducted in a standard assay with additional variable amounts of inhibitor. For the determination of the IC_{50} values (concentration of inhibitor required for 50% inhibition) at least five different inhibitor concentrations were applied.

These investigations were carried out with recombinant human as well as with recombinant murine DHODH provided by Prof. M. Löffler, Marburg, Germany [M. Löffler, Chem. Biol. Interact. 124, (2000), 61-76].

As a reference the active metabolite of leflunomide A77-1726 was used [J. Jöckel et. al. Biochemical Pharmacology 56 (1998), 1053-1060].
